Reviewer access & demo video

Play Console → App content → **App access**: select "All or some functionality is restricted" and add the instructions below. Google reviewers cannot receive real SMS OTPs, so one dedicated number signs in with a fixed code.

How it works (implemented)

- `lib/core/config/reviewer_access.dart` defines the reviewer number and fixed OTP.
- `ApiTicketRepository` skips the SMS send and the Gupshup check **only** for that number + code. Any other number, or any other code for that number, goes through the normal flow.
- Sign-in is otherwise unchanged: the number still goes through the `commonLogin` directory lookup and the OAuth token is still minted.

Backend prerequisites (must be true before submitting)

1. The reviewer number must exist in the SM-Partners directory as an **active** agent, otherwise `commonLogin` rejects it before the OTP step.
2. That agent must be a **dummy account** with sample tickets only. The bypass is readable by anyone who decompiles the app, so this account must never be a real agent and must never expose real customer data.
3. Optional: limit what the account can do server-side (no real recoveries).

Known limits

- End-shift and handover OTPs still use real SMS. Tell reviewers not to use them (or bypass them too if needed).
- Proof photos upload to real Azure storage; dummy photos only.

App access text (paste into Play Console)

> Sign in with mobile number 7995213738 and OTP 1234. The account has sample
>
> tickets. Grant location, camera and phone permissions when prompted. To test the
>
> call feature open any ticket → Call Customer → Start Call.

Removing it later

Delete `reviewer_access.dart` and the two `ReviewerAccess` checks in `ApiTicketRepository` (`requestLoginOtp`, `verifyLoginOtp`), and `test/unit/reviewer_access_test.dart`.

Demo video checklist (for CALL_PHONE / READ_PHONE_STATE)

Upload as unlisted YouTube/Drive link that opens without login.

1. Launch app, sign in (using the reviewer number + OTP).
2. Open a ticket → Call Customer.
3. Tap Start Call — show the permission prompt and the call being placed.
4. End call — show duration recorded in the app.
5. Show a text overlay: "Calling the customer is the core recovery workflow."

   Also briefly show location (geo-fence) and camera/QR use.
